

Wenshi Chen is an undergraduate senior at Rice University studying Musicology and Science & Technology Studies. Her research brings together musicology, cognitive science, philosophy, and technology to explore how people create and interact with music. She is especially interested in human-machine creativity, musical cognition, music information retrieval (MIR), and the growing role of AI and computational technologies in musical practice. Her current research focuses on live coding, machine learning-assisted improvisation, and musical memory, with a particular interest in how creativity and agency emerge through interactions between human performers and computational systems. At Rice, she designed and taught *Computer Music and Creative Coding Performance*, an undergraduate course introducing students to live coding and creative approaches to making music with code. She also works as a student researcher in Rice's Music, Mind & Body Lab, contributing to research on the neural dynamics of creativity in live performance, and in the Critical Media Lab, where she uses computational methods to study environmental themes in popular music. Her research on live coding has taken her to San Francisco, Chicago, Barcelona, and the International Computer Music Conference in Hamburg, and she has presented her work at national and regional conferences in musicology and music technology.
